

# An Introduction to **ReactJS** and **AWS Amplify**

Luke Smyth

# Prerequisites

- A development environment - <https://code.visualstudio.com/>
  - AWS account with some permissions - <http://console.aws.amazon.com/>
  - NodeJS - <https://nodejs.org/en/download/>
  - Git - <https://git-scm.com/downloads>
- 
- `git clone https://github.com/smythluke/recipe-book.git`

# Contents

- What is React JS?
- Create React App
- JSX & Elements
- React Components
- Handling State
- Handling Events
- Controlled Forms
- React Router
- What is AWS Amplify?
- Amplify Console
- Amplify CLI
- Amplify Libraries
  - Auth
  - API
  - Hosting

# What is React JS?

- A JavaScript library for building user interfaces
- It doesn't do anything back end
- Makes it easy to create interactive UIs
- Manages changes to the UI efficiently
- Lets you abstract detail so your code makes sense and can be reused

# Create React App

- `npx create-react-app recipe-book`
- `cd recipe-book`
- `npm start`
- Open a browser and go to <http://localhost:3000>
- Sets up babel and webpack

# Create React App

- ./package.json
- ./public/index.html
- ./public/manifest.json
- ./src/App.js
- ./src/App.css
- ./src/index.js
- ./src/index.css

# Bootstrap & scss

- Optional, it just makes it easier and quicker to get something looking remotely nice
- I'll try not to use it too much

- `npm install bootstrap`

- `npm install node-sass`

- **Within `./src/App.scss`**

```
@import "../node_modules/bootstrap/scss/bootstrap";
```

# JSX & Elements

- JavaScript XML (JSX) is an extension of JavaScript written for React
- Optional but recommended
- Lets you render components in a familiar way
- You can put JS expressions within JSX using `{ }` (but not statements)
- React elements are immutable objects and take less resources than DOM elements
- React DOM updates the DOM to match the React elements

# React Components

- Let you split the UI in to independent, reusable pieces
- Written as functions or classes
- Accept inputs and return React elements to display
- App is a component

# Handling State

- “The particular condition that something is in at a specific time”
- A component must be defined as a `class` if it is to have state
- Use a constructor to assign the initial `this.state` value
- `componentDidMount()` and `componentWillUnmount()`
- `this.setState({})` and `this.setState(function)`
- State updates are merged in a shallow way

# Handling Events

- Very similar to handling events on DOM elements
- Pass the event handler a function rather than a string
- Can't `return false` to prevent the default action
- You'll probably need `Function.prototype.bind()`

# Controlled Forms

- Single source of truth in the components state
- `value={this.state.example}`
- `onChange={this.handleChange}`
- **select elements don't use the selected attribute, this is stored in the elements value**
- **textarea elements have a value instead of children**

# React Router

- Allows your single page web app to act more like a traditional site
- `npm install react-router-dom`
- `BrowserRouter`, `Switch`, `Route`, `NavLink`

# What is AWS Amplify?

- Platform for building secure, scalable applications
- Version control, testing and deployment are all included
- Easily leverage other AWS services for authentication, data storage, analytics, machine learning + more
- Amplify Console
- Amplify CLI
- Amplify Libraries

# Amplify Console

- A place to view the services that you have configured as part of your project
- You can configure hosting options here too like custom domains and continuous deployment

# Amplify CLI - Global

- `npm install -g @aws-amplify/cli`
- `amplify configure`
- Sign in to the AWS console
- Create a new user or type the name of an existing one
- Ensure the user has Admin privileges
- Provide `accessKeyId` and `secretAccessKey` to the cli

# Amplify CLI- Per Project

- `amplify init`
- Enter a unique name – `recipe-book`
- Enter an environment name - `prod`
- Choose your code editor
- Select a javascript project with the react framework
- `src, build, npm build, npm start`
- default AWS profile

# Amplify CLI- Per Project

- `./src/aws-exports.js`
- `./amplify/.config/project-config.json`
- `./amplify/backend/backend-config.json`
- `./amplify/team-provider-info.json`

# Amplify Libraries

- Analytics
- **API**
- **Auth**
- Datastore
- Interactions
- Predictions
- PubSub
- PushNotification
- Storage
- XR

# Amplify Libraries

- `npm install aws-amplify @aws-amplify/ui-react`

- **Within `./src/index.js`**

```
import Amplify from 'aws-amplify';  
import awsConfig from './aws-exports';  
Amplify.configure(awsConfig);
```

# Amplify Libraries - Auth

- `amplify add auth`
- Select Default configuration
- Select Email
- `amplify push`

# Amplify Libraries - Auth

- Within `./src/AppWithAuth.js`

```
import {AmplifyAuthenticator} from '@aws-amplify/ui-react';  
<AmplifyAuthenticator usernameAlias="email">  
  <slots></slots>  
  <App />  
</AmplifyAuthenticator>
```

- Within `./src/Navigation.js`

```
Auth.signOut();
```

# Amplify Libraries - API

- `amplify add api`
- GraphQL
- **Enter a name** `recipebook`
- Amazon Cognito User Pool
- No, I am done.
- Single object with fields
- **Edit the schema**
- `amplify push`

# Amplify Libraries - API

- Within `./amplify/backend/api/<>/schema.graphql`

```
type Recipe
```

```
  @model
```

```
  @auth(rules: [{allow:owner}]) {
```

```
    id: ID!
```

```
    title: String
```

```
    description: String
```

```
    rating: Int
```

```
    link: String
```

```
    owner: String
```

```
  }
```

# Amplify Libraries - API

- Within `./src/AddRecipe.js`

```
import { API, graphqlOperation } from 'aws-amplify'
import { createRecipe } from './graphql/mutations'
API.graphql(graphqlOperation(createRecipe, {}))
```

# Amplify Libraries - API

- Within `./src/RecipeBook.js`

```
import { API, graphqlOperation } from 'aws-amplify'
import { listRecipes } from './graphql/queries'
API.graphql(graphqlOperation(listRecipes))
```

# Amplify Libraries - API

- Within `./src/RecipeBook.js`

```
import { API, graphqlOperation } from 'aws-amplify'
import { onCreateRecipe } from './graphql/subscriptions'
API.graphql(graphqlOperation(onCreateRecipe)).subscribe()
```

# Amplify CLI / Console - Hosting

- `amplify add hosting`
- Choose Amplify Console
- Choose manual deployment
- `amplify publish`
- **Rewrites and redirects**
  - `</^[^.]++$|\.(?! (css|gif|ico|jpg|js|png|txt|svg|woff|ttf|json) $) ([^.]++$) />`
